

Send Email

Send an email through a Gmail account.

Properties

Field	Type	Required	Default	Description
Receiver Email (To)	Array	Yes	—	One or more recipient email addresses
Subject	Text	Yes	—	Email subject line
Body	Text	Yes	—	Email body content
Body Type	Dropdown	Yes	plain text	plain text or html
CC Email	Array	No	—	Carbon copy recipients
BCC Email	Array	No	—	Blind carbon copy recipients
Reply-To Email	Array	No	—	Address(es) for the Reply-To header
Sender Name	Text	No	—	Display name shown as the sender
Sender Email	Text	No	—	Must be a verified alias in your Gmail settings
Attachments	Array	No	—	Files to attach (each item: File + optional Attachment Name)
In reply to	Text	No	—	Message-ID to thread the reply into an existing conversation
Create draft	Checkbox	Yes	false	Save as draft instead of sending

Output

When sending (**Create draft = false**):

```
{  
  "id": "18c1a2b3d4e5f678",  
  "threadId": "18c1a2b3d4e5f678",  
}
```

```
    "labelIds": ["SENT"]
  }
```

When saving as draft (Create draft = true):

```
{
  "id": "r1234567890abcdef",
  "message": {
    "id": "18c1a2b3d4e5f678",
    "threadId": "18c1a2b3d4e5f678",
    "labelIds": ["DRAFT"]
  }
}
```

Notes

- **Sender Email** — if omitted, the authenticated account's primary email is used automatically.
- **In reply to** — sets the **In-Reply-To** and **References** headers so the email is grouped into an existing thread. Accepts a Gmail Message-ID (e.g. <CABcd1234@mail.gmail.com>).
- **Attachments** — content type is auto-detected from the file extension. Each attachment entry accepts an optional custom name to override the original filename.
- **Body Type html** — pass a full HTML string in the Body field; it will be sent as the **text/html** MIME part.
- **Subject** is encoded as UTF-8 Base64 internally to support non-ASCII characters.
